

When a Report Breaks at 2 AM, Someone Should Already Know Why

An always-on assistant that watches your data systems, catches failures early, and explains what broke and why — in plain English, not a wall of logs.

WHO NEEDS THIS

IT operations teams, and the business leaders who depend on the reports, dashboards, and nightly data jobs those teams keep running.

WHY IT MATTERS

Every hour spent hunting through logs to explain why a report didn't load is an hour a business decision waited on stale information.

WHAT IT DOES

Turns hours of log-hunting into a one-screen explanation.

Estimated

Explains a failure two ways at once — the technical detail an engineer needs, and the plain-English version a business leader can act on — with no manual translation.

Estimated benefit, not yet measured

Never makes a change to a live system on its own — every fix still needs a person's sign-off.

Design guarantee

WHAT'S NEXT

We're testing whether the explanation is trustworthy enough to act on — one real failure, one screen, one week.
